

Flightless @ Dinosaur Descendants

Ratites refer to a group of flightless birds, such as the kiwi and rhea.

What is the 'bone' that is missing on the chest of the ratites that make them different from most of the flying birds?

[Hint: Visit the Ostrich hut.]

Flightless pals

Name the other flightless birds that are found along Dinosaur Descendants.

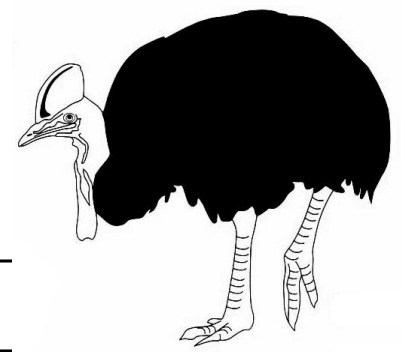

1. _____
2. _____
3. _____

Deadly claws

This bird is considered the most dangerous of all birds. It has large and sharp claws that can kill a large animal when provoked. Find out what bird is this.

[Hint: it has a casque on its head.]

How does it use its 'helmet' to adapt to living in the forests?

Many decades ago, the ostrich was hunted heavily for its meat, egg and skin, and the population plummeted drastically. Fortunately, ostrich farming was introduced. These farmed birds were released back into the wild, saving them from following in the footsteps of the Dodo.

Different parts of the ostrich are used to make products. What are some of these products that are displayed at the ostrich hut?
